Summary

Technical Product Manager and CS & AI senior (May 2027) who writes the code he scopes. Built Iranti, an MCP memory server for coding agents, to 15,360 npm downloads across 92 releases, and wrote a 4-benchmark eval against Mem0, Shodh, and Graphiti. Built Bothy solo on a Kotlin Multiplatform core, live on the iOS App Store, with 8.4 ms typeahead over 10,000 items.

Skills

Languages: Python, TypeScript, JavaScript, Kotlin, Java, SQL, HTML/CSS
Frameworks: React, Next.js, Flask, Android SDK, Prisma ORM, REST APIs
AI & Data: MCP Servers, LLM Evals, Anthropic & OpenAI APIs, PostgreSQL + pgvector, Git/GitHub
CS Fundamentals: Data Structures & Algorithms, Distributed Systems, OOP Design, System Architecture

Education

Minerva University San Francisco, CA
Bachelor of Science, Computer Science & Artificial Intelligence (1% acceptance rate) *Sep 2023 – May 2027*

- Relevant Coursework: Data Structures & Algorithms, Formal Analysis, Complex Systems, Linear Algebra

Experience

Technical Product Manager, Cofactor Feb 2026 – Present
San Francisco, CA (Remote)

- Shipped B2B SaaS platform (Next.js, TypeScript, Supabase) from first commit to live users in four weeks
- Fixed an enqueue and database write race in the GDPR Article 14 notice pipeline, protecting a legal deadline
- Built GDPR-compliant architecture with data mapping, privacy controls, and export and deletion workflows
- Integrated Anthropic Claude API and academic data APIs to automate validation of submitted research leads

Process Optimization Analyst, UL Solutions May 2025 – Aug 2025
Fremont, CA

- Reduced test data errors by 50% by building Python automation scripts into the lab cross-functional systems
- Cut three weeks off testing on an estimated $6M+ program by redesigning three operational workflows
- Implemented validation protocols ensuring regulatory compliance across 200+ technical test procedures

Product Builder, Google Academic Collaboration Sep 2023 – May 2024
San Francisco, CA

- Proposed and prototyped 4 Google Photos features for long-distance relationships with a 5-person team
- Built interactive prototypes in Figma and ran quantitative analysis on each round of user studies
- Raised engagement 40% in prototype A/B tests across 50+ study participants

Technical Projects

Iranti - Shared Memory Substrate for Multi-Agent Coding | *TypeScript, MCP, PostgreSQL, pgvector, Python*

- Reached 15,360 downloads on npm across 92 releases with no paid marketing, through organic adoption
- Eliminated write races with per-identity locking via pg_advisory_xact_lock and Promise queuing
- Wrote a 4-benchmark eval vs Mem0, Shodh, and Graphiti, finding deterministic replacement beats accumulation
- Resolved 9/10 conflicting writes to one current value in that eval, where Shodh returned both versions 10/10
- Kept 40/40 facts through a full process restart in that eval, tying Shodh, vs 30/40 Mem0 and 23/40 Graphiti

Bothy - Clipboard Vault App (on the App Store) | *Kotlin Multiplatform, Compose, SwiftUI, SQLDelight*

- Built the app solo on a Kotlin Multiplatform core, with Jetpack Compose on Android and native SwiftUI on iOS
- Hit 8.4 ms average typeahead over 10,000 items in JVM tests using SQLDelight with an FTS5 full-text index
- Fixed a first-launch Android crash by bundling sqlite-android, since the system SQLite lacks FTS5
- Shipped iOS to the App Store at a $4.99 lifetime unlock and ran a 12-tester Android closed test for Shipaton 2026

CLI-UNO - UNO Engine with Four AI Tiers | *Python, Simulation, Game AI*

- Built an experiment harness that ran 100 games per AI tier against a simulated human, 400 games in total
- Found the Medium tier won 52/100 while the two Hard strategies won 38 and 41, so harder was not stronger
- Implemented the full rules engine from the official UNO rules, including wilds and two-player reverse as skip
